

/ MarPier™ /

Strong Support for Biomedia

MarPier is a specialized support system for biological treatment applications. It can be configured to accommodate various tank floor slopes and provides a firm foundation for all common filler configurations.

As the base support for biological trickling filter media, MarPier consists of a heavy schedule PVC pipe with an injection molded cap and base of a durable engineering plastic.

The base consists of two wedge-shaped parts capable of accommodating sloped floors. After the base is leveled and anchored to the floor, the PVC pipe post is cut to length and the components are assembled using PVC cement.

Pier Pressure

The MarPier has been tested to loads over 27,000 pounds.
