

THE NC-QUIET BY DESIGN

The NC is the result of extensive design studies focused on cooling tower sound control. These studies were complicated by the fact that the cooling tower market is typically driven by one of two powerful, yet often conflicting requirements. The most common is for a cooling tower that provides the required heat rejection capacity with a high level of reliability at low cost. Sound control, while important, is not the primary consideration for this application.

The other requirement, which is becoming ever more important in our crowded, fast-paced society, is driven by conditions that demand the lowest practical sound level. Energy efficiency, reliability, ease of maintenance and reasonable cost, while still extremely important, are not the highest priorities

In the first case, sound is important, while in the second case it is extremely important. To best satisfy these two competing market requirements we created a multi-tiered approach, through key mechanical equipment selections, to sound control. The result is more options than any other cooling tower on the market today.

The result is a line of towers capable of meeting all but the most restrictive noise limitations—and that will react favorably to natural attenuation. Where the tower has been sized to operate within an enclosure, the enclosure itself will have a damping effect on sound. Sound also declines with distance—by about 6 dBA each time the distance doubles.

All standard NC cooling towers are equipped with low sound fans. This in combination with zero-splash crossflow film-fill results in a line of towers capable of meeting most noise limitations. Where noise at a critical point is likely to exceed an acceptable limit, several other options are available—listed below in ascending order of cost impact:

- The Marley "Quiet Package" includes the affordable Quiet Fan mechanical option, optimized to achieve the lowest possible sound levels while maintaining efficiency.
- A Marley Variable Speed Drive automatically minimizes the tower's noise level during periods of reduced load and/or reduced ambient temperature without sacrificing the system's ability to maintain a constant cold water temperature. This is a relatively inexpensive solution, and can pay for itself quickly in reduced energy costs. The natural nighttime reduction in wetbulb temperature makes this a very feasible solution in most areas of the world. It also eliminates fan cycling. In combination with a Marley Quiet Package, the Marley Variable Speed Drive is capable of meeting all but the most restrictive noise limitations.
- The most extreme cases may require inlet and discharge sound attenuator sections—however, the static pressure loss imposed by discharge attenuators may necessitate an increase in tower size. Two stages of inlet or discharge attenuators supported by the tower and designed and tested for the most stringent requirements are available as an option. See page 24.
- For more severe cases requiring the lowest possible fan sound levels the Marley "Ultra Quiet" fan option is now available on most NC models. Tower height will increase—obtain current sales drawings from your Marley sales representative for accurate dimensions.

The advantage is yours. You now have the choices you need to balance your project's performance, space and cost requirements with your sound level needs for a win-win solution to your cooling system design.

ENCLOSURES

Occasionally, cooling towers are located inside architectural enclosures for aesthetic reasons. Although NC towers adapt well to enclosures, the designer must realize the potential impact of a poorly arranged enclosure on the tower's performance and operation. The designer must take care to provide generous air inlet paths, and the tower's fan cylinder discharge height should not be lower than the elevation of the top of the enclosure. Marley white paper *Thermal Science H-004* "External Influences on Cooling Tower Performance" is available at spxcooling.com or from your Marley sales representative.

As suggested in the aforementioned Technical Report, it may also be advisable to specify a design wet-bulb temperature ½°C higher than normal to compensate for potential recirculation initiated by the enclosure. You'll benefit from discussing your project with your Marley sales representative.

Marley "Ultra Quiet" fan

SYSTEM CLEANLINESS

Cooling towers are very effective air washers. Atmospheric dust able to pass through the relatively small louver openings will enter the circulating water system. Increased concentrations can intensify system maintenance by clogging screens and strainers—and smaller particulates can coat system heat transfer surfaces. In areas of low flow velocity—such as the cold water basin—sedimentary deposits can provide a breeding ground for bacteria.

In areas prone to dust and sedimentation, you should consider installing some means for keeping the cold water basin clean. Typical devices include side stream filters and a variety of filtration media.

WATER TREATMENT

To control the buildup of dissolved solids resulting from water evaporation, as well as airborne impurities and biological contaminants including Legionella, an effective consistent water treatment program is required. Simple blowdown may be adequate to control corrosion and scale, but biological contamination can only be controlled with biocides.

An acceptable water treatment program must be compatible with the variety of materials incorporated in a cooling tower—ideally the pH of the circulating water should fall between 6.5 and 8.0. Batch feeding of chemicals directly into the cooling tower is not a good practice since localized damage to the tower is possible. Specific startup instructions and additional water quality recommendations can be found in the NC User Manual which accompanies the tower and also is available from your local Marley sales representative. For complete water treatment recommendations, consult a competent, qualified water treatment supplier.

A CAUTION

The cooling tower must be located at such distance and direction to avoid the possibility of contaminated discharge air being drawn into building fresh air intake ducts. The purchaser should obtain the services of a Licensed Professional Engineer or Registered Architect to certify that the location of the cooling tower is in compliance with applicable air pollution, fire and clean air codes.

TYPICAL APPLICATIONS

The NC tower is an excellent choice for normal applications requiring cold water for the dissipation of heat. This includes condenser water cooling for air conditioning, refrigeration, and thermal storage systems, as well as their utilization for free-cooling in all of those systems. The NC can also be used in the cooling of jacket water for engines and air compressors, and are widely applied to dissipate waste heat in a variety of industrial, power and manufacturing processes.

Choosing the all stainless steel construction option, the NC can be confidently applied in unusually corrosive processes and operating environments. However, no single product line can answer all problems, and selective judgement should be exercised in the following situations

SPX participates in the ECP programme for Cooling Towers. Range – NC Series. Certification Diploma #12.02.007. Ongoing certificate validity: eurovent-certification.com

APPLICATIONS REQUIRING ALTERNATIVE COOLING TOWER SELECTIONS

Certain types of applications are incompatible with any cooling tower with film fill—whether NC or a competitive tower of similar manufacture. Film fill is subject to distortion in high water temperatures, and the narrow passages are easily clogged by turbid or debris-laden water. Some of the applications, which call for alternative tower designs are:

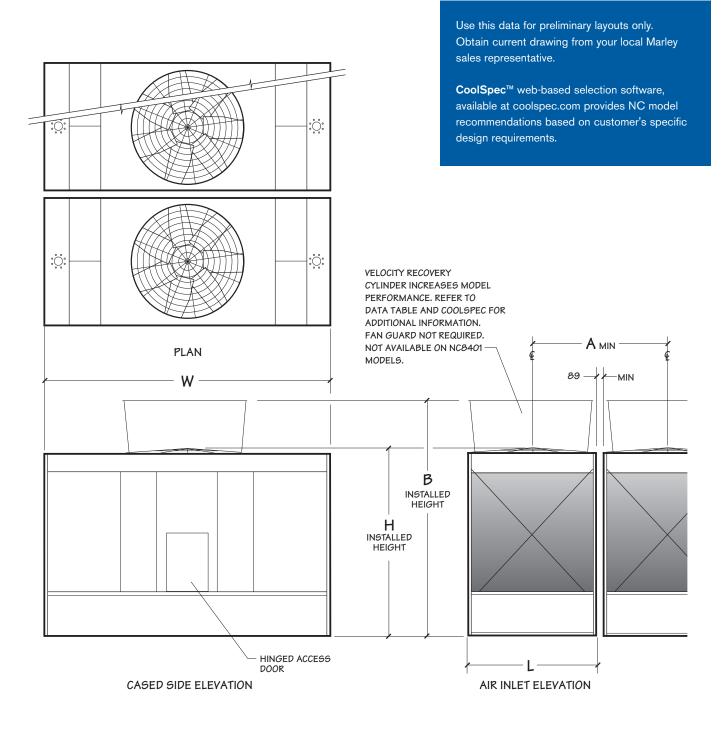

- Ethylene glycol content—can plug fill passages as slime and algae accumulate to feed on the available organic materials.
- Fatty acid content—found in processes such as soap and detergent manufacturing and some food processing—fatty acids pose a serious threat for plugging fill passages.
- Particulate carry over—often found in steel mills and cement plants—can both cause fill plugging, and can build up to potentially damaging levels on tower structure.
- Pulp carry over—typical of the paper industry and food processing where vacuum pumps or barometric condensers are used. Causes fill plugging which may be intensified by algae.

ALTERNATIVE SELECTIONS

In addition to the NC, SPX Cooling offers a full scope of products in various designs and capacities to meet the special demands of specific applications.

When the ambient air temperature falls below 0°C, the water in a cooling tower can freeze. Marley white paper *Thermal Science H-003* "Cooling Towers and Freezing Weather" describes how to prevent freezing during operation. Available at spxcooling.com or from your Marley sales representative.

During shutdown, water collects in the cold water basin and may freeze solid. You can prevent freezing by adding heat to the water left in the tower—or, you can drain the tower and all exposed pipework at shutdown.

ELECTRIC BASIN HEATERS

An automatic basin water heater system is available consisting of the following components:

- Standard weatherproof (IP55) enclosure, rating depending on model and minimum expected winter temperature.
- Ratings are in kW for specified ambient temperature. For lower ambient temperatures refer to SPX engineering for advice.
- Standard electrical supply is 380/415 V 3ph (220/240V 1 ph available as extra cost option).
- Heater has an integral thermostat, set point nominally 3°C but adjustable to suit operating requirements.

Heater components are normally shipped separately for installation by others.

Note: any exposed piping that is still filled with water at shutdown—including the makeup water line—should be electrically traced and insulated (by others).

INDOOR STORAGE TANK

With this type of system, water flows from an indoor tank, through the load system, and back to the tower, where it is cooled. The cooled water flows by gravity from the tower to the tank located in a heated space. At shutdown, all exposed water drains into the tank, where it is safe from freezing.

The amount of water needed to successfully operate the system depends on the tower size and flow and on the volume of water contained in the piping system to and from the tower. You must select a tank large enough to contain those combined volumes—plus a level sufficient to maintain a flooded suction on your pump. Control makeup water according to the level where the tank stabilizes during operation.

Tired of having to design your piping and tower layout to accommodate the standards of cooling tower manufacturers? Marley's multiple variety of piping systems accommodates your design intentions to make your layout of the NC both expedient and economical.

- · Single or dual hot water inlet connections.
- Side inlet, bottom inlet or top inlet connections.
- Side cold water outlet connections. NC8401-NC8414.
- · Bottom cold water outlet connections.
- A variety of makeup, overflow and drain options.

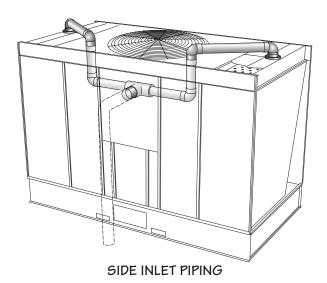

For the single inlet connection all piping to the distribution basins is part of the tower package. Installation and design costs are reduced and the need for extra piping and supports are eliminated. The single bottom inlet connection is perfect for multicell applications—keeping all the inlet piping below the tower.

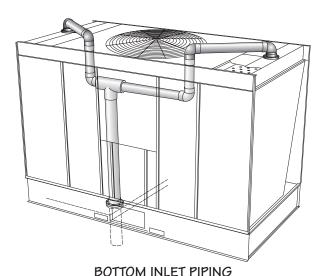

Unless otherwise specified, single-cell towers — NC8401 through NC8414 — normally have a cased-face outlet appropriate for the design water flow rate—see pages 20 and 21. This usually assures the lowest possible installed tower elevation. Cased-face outlet connection pipes extend approximately 3" outside the basin, and are beveled for weld connection and also grooved for a mechanical coupling.

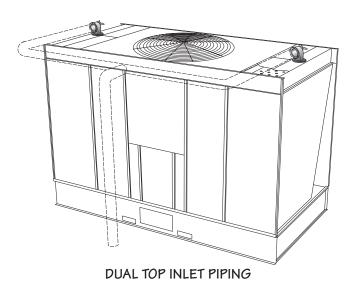

Outlet piping can be kept below the cold water basin level by choosing either a depressed sump or a bottom outlet connection in lieu of the cased-face outlets. Both outlet designs conform to standard class 125 ANSI pipe flange specifications. Easily removable debris screens are optional on bottom outlets and are standard on all other outlet arrangements.

Depressed sumps are made of inert fire-retardant FRP or heavy-gauge welded stainless steel. Unless otherwise specified towers with galvanized steel collection basins are supplied with FRP sumps and towers with stainless steel basins are supplied with stainless sumps.

Multicell towers, intended to operate together as a common unit, are joined by steel flumes between the collection basins or piping below the tower basins. These connectors equalize the operating water level between basins and also provide a flow passage from cells not equipped with outlets or makeup valves, often eliminating the need to specify an outlet and makeup valve for each cell on a multicell installation.

If each cell is to be equipped with an outlet, cased-face outlet — NC8401 through NC8414 — can be used on end cells of multicell towers, but not on interior cells. For direct outlet from each cell on installations of three or more cells, use either the depressed sump or bottom outlet on interior cells.

The best choice for a tower used with a remote or indoor storage tank—see page 13—or on a concrete cold water basin is usually a bottom outlet.

A cased-face outlet equipped tower — NC8401 through NC8414 — can be installed on a flat concrete slab if a side drain and overflow are also specified—see page 20. Consult your Marley sales representative for complete information.

MAKEUP

The amount of water constantly evaporated from a cooling tower varies directly with the heat load applied. In addition to evaporation, water is normally lost to the blowdown (bleed-off) necessary to maintain dissolved solids concentration at an acceptable level in the circulating water system.

The NC is equipped with one or more float-operated, mechanical makeup valves to automatically replenish this lost water. The tables on this page, calculated for a concentration of 3 times normal, indicate the rate of water loss—and the size of valve(s) required. If your installation's cold water basin will drain by gravity to a remote storage tank—or if you plan a separate means of controlling makeup water—a price reduction is available for deleting the Marley valve(s). We also offer an optional electronic liquid-level control.

In most instances cooling towers will see the highest water usage at design heat load. Off design conditions (99% of the time) water usage will be less. For a better understanding of how much water your application will use throughout the year, consult our water usage calculator at:

spxcooling.com/water-calculator

If too much water is still being consumed consult your Marley sales representative for water saving alternatives.

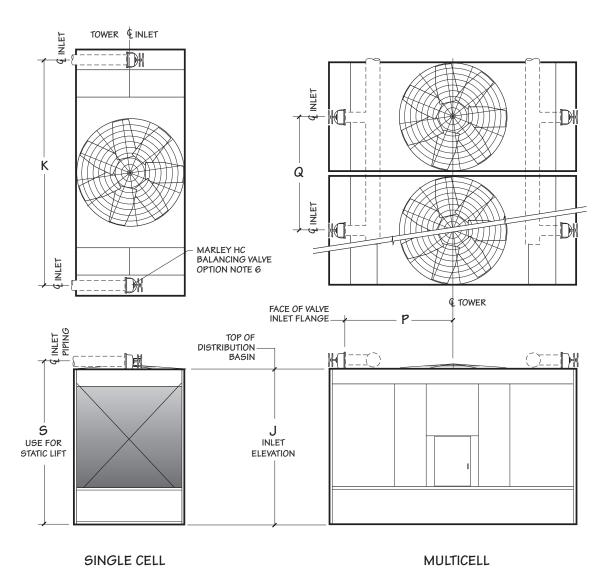

| | Makeup Water Flow Required – m³/hr to Maintain Three (3) Concentrations | | | | | | |
|--------------------------|--|------------|-------------|------------|------------|------|--|
| T 3/I | Co | oling "Rar | nge" (hot v | vater minu | s cold wat | ter) | |
| Tower m ³ /hr | 3°C | 6°C | 8°C | 12°C | 17°C | 24°C | |
| 45 | .5 | .7 | .9 | 1 | 2 | 2 | |
| 91 | .7 | 1 | 2 | 2 | 3 | 5 | |
| 136 | .9 | 2 | 3 | 3 | 5 | 7 | |
| 182 | 1 | 2 | 3 | 5 | 7 | 9 | |
| 227 | 2 | 3 | 4 | 6 | 9 | 11 | |
| 341 | 2 | 4 | 7 | 9 | 13 | 17 | |
| 454 | 3 | 6 | 9 | 11 | 17 | 23 | |
| 681 | 4 | 9 | 13 | 17 | 26 | 34 | |
| 908 | 6 | 11 | 17 | 23 | 34 | 45 | |
| 1135 | 7 | 14 | 21 | 28 | 43 | 57 | |
| 1362 | 9 | 17 | 26 | 34 | 51 | 68 | |
| 1816 | 11 | 23 | 34 | 45 | 68 | 91 | |

NOTE

 If circulating water is to be maintained at 2 concentrations instead of 3, multiply table m³/hr values by 1.36 before sizing makeup valve.

| Makeup Valve Flow Capacities - m³/hr | | | | | | |
|--|-------------------|-------------------|--|--|--|--|
| Pressure at Valve Inlet while flowing-kPa | 1" Diameter Valve | 2" Diameter Valve | | | | |
| 69 | 13 | 20 | | | | |
| 138 | 18 | 27 | | | | |
| 207 | 21 | 33 | | | | |
| 276 | 24 | 36 | | | | |
| 345 | 27 | 38 | | | | |

- If makeup water pressure exceeds 345 kPa, use pressure reducer ahead of valve.
- For flow requirements exceeding the above limitations, use multiples of the same size valve.

- 1 Use this bulletin for preliminary layouts only. Obtain current drawings from your Marley sales representative.
- 2 Pumping head contributed by the tower is static lift "S". Add your system dynamic pipe losses for total.
- 3 The tower will support the vertical weight of piping shown within the plan area of the tower only. All piping loads, including thrust and lateral loads of riser and horizontal piping must be supported independent of the tower. See inlet piping drawings for details.
- 4 All piping and supports-and their design-are by others.
- 5 Allow adequate clearance for entry to tower access doors and safe use of optional ladder. Refer to appropriate Marley drawings.
- 6 You may choose to use 90° short radius flanged elbows in place of HC balancing valves on single-cell towers where inlet piping is balanced for equal flow. Pipe elevation remains as shown.

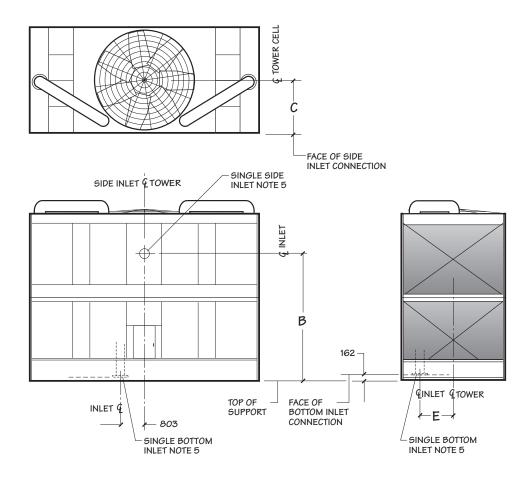

| Model | | Inlet Diameter | | | |
|--------|------|----------------|-----|------|-----------------|

NOTE -

- 1 Use this bulletin for preliminary layouts only. Obtain current drawings from your Marley sales representative.
- 2 All external piping loads, including weight, thrust and lateral loads of riser and horizontal piping plus the weight of water in the internal riser must be supported independent of the tower. Internal riser adds additional vertical operating loads to external piping at the bottom inlet flange.
- 3 All piping and supports beyond the inlet connection—and their design—are by others.
- 4 Allow adequate clearance for entry to tower access doors and safe use of optional ladder. Refer to appropriate Marley drawings.

SINGLE BOTTOM INLET NOTE 5

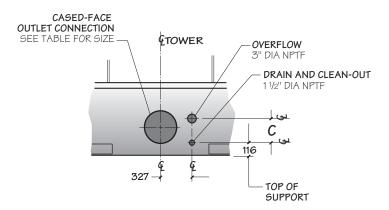

- 5 You may choose either a bottom inlet connection or a side inlet connection. The bottom inlet connects at the tower collection basin floor. Refer to appropriate Marley drawings.
- 6 Contact your Marley sales representative for the required pump head for single-inlet applications.
- Weight of internal piping must be added to tower weights. Contact your Marley sales representative for combined tower weight information.

| NC8414 | 286 | 2143 | 338 | | | | |

CASED-FACE OUTLET CONNECTION

Standard overflow is a 4" dia. standpipe in the collection basin floor.
 The standpipe removes for flush-out and draining.

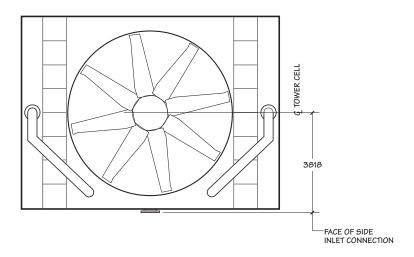

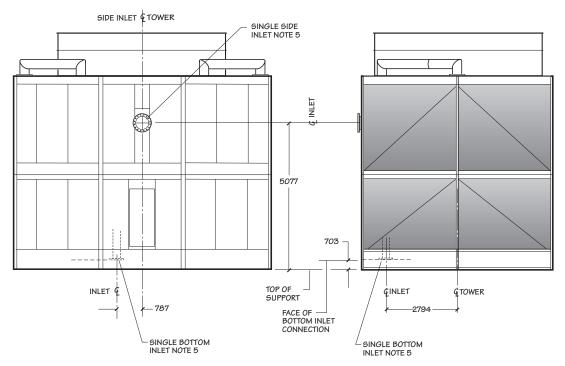

DEPRESSED SIDE-OUTLET SUMP CONNECTION

STAINLESS STEEL OR FRP

| | | Maximum F | low Per | Outlet Di | ameter | | | | | | | |
|-------------|--|--------------------|---------|-----------|--------|-------|-------|-------|-------|-------|-------|-------|
| | | | m³/h | r | | | | | | | | |
| 0 11 1 7 | Outlet Diameter | | | | | | | | | | | |
| Outlet Type | Flow Type | Model | 4" | 6" | 8" | 10" | 12" | 14" | 16" | 18" | 20" | 24" |
| Bottom | pump flow w/ anti-vortex plate or gravity flow w/ or w/o anti-vortex plate | NC8401 thru NC8405 | 35.6 | 80.6 | 143 | 225.5 | 320.9 | 392.7 | 519 | 569.9 | 754.5 | 912.8 |
| | | NC8407 thru NC8414 | 37.9 | 86.3 | 152.8 | 241 | 342.9 | 419.7 | 554.6 | 718.6 | 869.7 | 1112 |
| | pump flow w/o anti-vortex plate | NC8401 thru NC8414 | 16.1 | 36.8 | 65.2 | 102.8 | 146.2 | 179 | 236.7 | 306.4 | 380.7 | 552.6 |
| | pump flow w/ anti-vortex plate or gravity flow w/ or w/o anti-vortex plate | NC8401 thru NC8405 | | 204.4 | 362.3 | 571.2 | 812.6 | 973 | | | | |
| Sump | | NC8407 thru NC8414 | | 204.4 | 362.3 | 571.2 | 812.6 | 994.6 | | | | |
| | pump flow w/o anti-vortex plate | NC8401 thru NC8414 | | 143 | 253.5 | 400 | 568.9 | 696.1 | | | | |
| Cased-Face | | NC8401 thru NC8405 | | 204.4 | 362.3 | 571.2 | 812.6 | | | | | |
| Outlet | pump flow only | NC8407 thru NC8414 | | 204.4 | 362.3 | 571.2 | 812.6 | 994.6 | | | | |

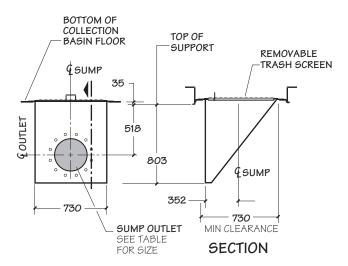

- Flow rate may be limited by the maximum flow for unit size.
- For gravity-flow situations (as to an indoor tank), use bottom outlet or depressed side outlet sump. Cased-face outlet is not recommended for gravity flow.
- Flow limits are the outlet capacities per outlet based on the design operating water level-216mm above the top of support on models NC8401 through NC8405-241mm on NC8407 thru NC8414.

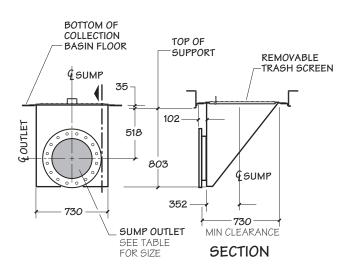

NOTE -

- 1 Use this bulletin for preliminary layouts only. Obtain current drawings from your Marley sales representative.
- 2 All external piping loads, including weight, thrust and lateral loads of riser and horizontal piping plus the weight of water in the internal riser must be supported independent of the tower. Internal riser adds additional vertical operating loads to external piping at the bottom inlet flange.
- 3 All piping and supports beyond the inlet connection—and their design—are by others.
- 4 Allow adequate clearance for entry to tower access doors and safe use of optional ladder. Refer to appropriate Marley drawings.
- 5 You may choose either a bottom inlet connection or a side inlet connection. The bottom inlet connects at the tower collection basin floor. Refer to appropriate Marley drawings.
- 6 Contact your Marley sales representative for the required pump head for single-inlet applications.
